

Unibud

Concept Specification

Transcribed and structured from four pages of handwritten notes (iOS notebook scan, 21 September 2026). Pages 1 and 4 of the source are a cover and a blank sheet; all content comes from pages 2 and 3.

What this document is

A faithful write-up of the Unibud notes. Everything in **Part A** is a direct transcription of what the notes say. **Part B** onward is structure and interpretation derived from them — clearly separated so nothing gets mistaken for an original decision. Genuine gaps are collected in **Open Questions** rather than guessed at.

Part A · Source Transcription

Page 2 — feature notes

Titled "**Unibud**", hand-lettered in green inside a drawn cloud. Five feature lines, then a short checklist:

- *add your subjects and schedule*
- *asks **daily** for your deadlines and assignments*
- *quizzes and deadlines tab, and reminders*
- *allows you to upload your documents*
- *allows you to divide the chapters and content*

Checklist item	State in notes
add schedule	✓ ticked
reminders	unticked
todo	unticked
upload data	unticked

Page 3 — screen sketches

Two screens. The first is labelled "**subjects page**" with the word "**Files**" beside it: a two-column grid of six folder icons. The second is labelled "**inside the subject**": one large content panel with a four-item tab bar drawn beneath it.

Subjects	Files
Subject 1	Subject 2
Subject 3	Subject 4
Subject 5	Subject 6

Subjects page — folder grid

Chapters & content (uploaded documents)			
doc	todo	deadline	home

Inside the subject — content + tab bar

The tab bar reads, left to right: **doc** | **todo** | **deadline** | **home**. Redrawn above from the sketch; proportions are approximate.

Part B · The Product

Summary

Unibud is a study companion for university students. A student registers their subjects and their class schedule; the app then organises everything for those subjects — uploaded documents split into chapters, to-dos, quizzes and deadlines — and prompts the student daily to keep deadlines and assignments current.

The organising idea

The subject is the container for everything. The notes are consistent on this: the home screen is a grid of subjects drawn as folders, and documents, to-dos and deadlines all live inside a subject rather than in flat global lists. This single decision drives the data model and the navigation.

The daily prompt is the distinctive feature. Most study apps wait for the student to enter data. These notes specify that Unibud asks, every day, for new deadlines and assignments — it pulls rather than waits. This implies a recurring notification and a fast capture flow, neither of which the notes describe yet.

Information architecture

Level	Contains	From the notes
Student	Subjects, class schedule, daily prompt settings	"add your subjects and schedule"
Subject	Documents, chapters, to-dos, deadlines, quizzes	Folder grid; "inside the subject"
Document	Chapters / content sections	"divide the chapters and content"
Cross-subject views	Deadlines & quizzes tab, reminders	"quizzes and deadlines tab and reminders"

Screens and navigation

Four destinations are named in the sketched tab bar. Note that **home** sits in the same bar as the subject-level tabs, so the bar is most likely app-global rather than scoped to one subject:

Tab	Purpose	Source
home	Subjects grid; entry point and daily prompt surface	"subjects page" sketch
doc	Uploaded documents, divided into chapters	"upload your documents", "divide the chapters"
todo	Tasks, per subject and combined	Checklist item "todo"
deadline	Deadlines and quizzes, with reminders	"quizzes and deadlines tab and reminders"

Feature inventory

Every feature stated in the notes, with the work each one implies. Effort is a rough relative estimate, not a schedule.

Feature	What it implies	Effort
Add subjects	Create / rename / delete a subject; the folder grid on home.	Low
Add schedule	Weekly recurring class times per subject; a timetable view.	Medium
Daily prompt for deadlines & assignments	Recurring local notification at a chosen time, plus a quick-capture screen that writes straight into a subject.	Medium
Deadlines & quizzes tab	Dated items with a type (quiz / assignment / exam), sorted across all subjects.	Low
Reminders	Scheduled notifications ahead of each deadline; needs a lead-time rule and permission handling.	Medium
To-dos	Checkable tasks, owned by a subject, optionally linked to a deadline.	Low
Upload documents	File picking, storage, and in-app viewing. Formats not specified in the notes.	Medium
Divide chapters and content	Sectioning a document into chapters. The notes do not say whether this is manual or automatic — see Open Questions. This is the largest unknown in the concept.	High

Part C · Build Order

The checklist on page 2 reads as an intended sequence — *add schedule* → *reminders* → *todo* → *upload data* — with the first item already ticked. Expanded, with subjects placed first because every later item depends on them:

#	Milestone	Why here
0	Subjects: create, list, open	Nothing else can be attached until a subject exists. Not in the checklist, but implied by every item that is.
1	Schedule — <i>ticked in the notes</i>	First item on the student's checklist; gives the app a reason to open daily.
2	Deadlines, quizzes and reminders	The reminder system and the daily prompt share one notification layer — build them together.
3	To-dos	Small, and reuses the subject and deadline models already built.
4	Document upload	First milestone needing file storage; deliberately after the cheaper wins.
5	Chapter / content division	Depends on upload, and carries the most unresolved design. Last by necessity.

Open questions

These are genuinely unanswered in the notes. Each one changes the scope of the work, so they are recorded rather than assumed away.

#	Question	Why it matters
1	Which platform? The sketched bottom tab bar points to a mobile app, but the notes never say.	Decides the entire stack. The daily prompt and reminders depend on local notifications, which are far simpler on native mobile than on the web.
2	Is chapter division manual or automatic? "divide the chapters and content" could mean the student marks sections by hand, or the app parses the file.	Manual is a few days of work. Automatic parsing of arbitrary PDFs and slide decks is the single largest item in the project.
3	Which file types can be uploaded? Not stated.	PDF-only is straightforward; adding Word, slides and images multiplies the viewer and parsing work.
4	Local-only or synced account? No mention of login, accounts or sharing.	Local-only removes the backend entirely for v1. Sync adds auth, storage and cost.
5	When does the daily prompt fire, and what exactly does it ask?	This is the feature that makes Unibud distinctive; a badly timed or repetitive prompt is the fastest way to get the app muted.
6	Is the tab bar global or per subject? "home" appearing inside the subject view is ambiguous.	Determines whether to-dos and deadlines have cross-subject views, per-subject views, or both.

Suggested next step

Answering questions 1 and 2 unblocks everything else. With a platform chosen and chapter division scoped to manual sectioning for v1, milestones 0–3 form a coherent first release: **subjects, schedule, deadlines with reminders, and to-dos** — a usable app without any document handling. Upload and chapters then land as a second release, which is also the order the handwritten checklist already puts them in.

Source: 4-page handwritten notebook scan, *Unibud*. Pages 2–3 carry all content; pages 1 and 4 are a cover and a blank sheet. Transcription verified against page renders — the embedded OCR text layer in the original was unreliable and was not used.
